The Aug. 27-28, 2026 Eclipse of the Moon

An Information Sheet by **Andrew Fraknoi** *(U. of San Francisco, Fromm Institute)*

1. What Is Happening?

The evening of Thursday, August 27th , an eclipse of the Moon will be visible. In a lunar eclipse, the Moon and the Sun are exactly opposite each other in our sky, and the Earth gets between them. This means the Earth's shadow falls on the full Moon, darkening it. In this case 96% of the Moon's area will be covered by the shadow. It's a nicely *democratic* event; no special equipment is needed to see it (provided it's not cloudy or foggy.)

2. When Will the Eclipse Happen in Different US Time Zones?

Phase	Pacific	Mountain	Central	Eastern
The partial eclipse begins	7:33 pm	8:33 pm	9:33 pm	10:33 pm
The maximum eclipse occurs	9:12 pm	10:12 pm	11:12 pm	12:12 am
The partial eclipse ends	10:52 pm	11:52 pm	12:52 am	1:52 am

Note: The Moon rises: L.A. 7:17 pm, SF 7:38, Portland 7:49, Seattle 7:51

As the Moon moves slowly through Earth's shadow, we first see only part of the Moon darkening (partial eclipse). But then, as the Moon moves further into the shadow, we see more and more of the Moon's disk become dark and reddish. Then the Earth's shadow slowly moves off the Moon, restoring us to a full Moon. (Maximum eclipse is best time to view.)

3. What Is Visible During a Lunar Eclipse?

As the shadow of the Earth covers the Moon, note that our natural satellite doesn't become completely dark. Some of the sunlight bent by the Earth's atmosphere still reaches the shadowed Moon and gives it a dull brown or reddish glow. The exact color of the glow and its darkness depend in part on the "sooty-ness" of our atmosphere – how recently volcanoes have erupted, plus how much cloud cover, storm activity, fire smoke, and human pollution there is around the globe.

4. Is It Safe to Watch, and How Do I Watch?

Since the Moon is safe to look at, and eclipses make the Moon *darker,* there's no danger in watching the eclipse with your eyes, binoculars, or a telescope. And lunar eclipses don't require you to go to a dark location. Bring binoculars to see the Moon larger, but just your eyes are fine. Be sure to bundle up against a cold night and to take someone along with whom you like to spend time in the dark!

5. What Can I Tell My Kids (or Grandkids)?

Suggest that they take a careful look at the shadow of the Earth as it moves across the bright face of the Moon. What shape is it? The round shape of the Earth's shadow during such eclipses suggested to the ancient Greeks, more than 2000 years ago, that the Earth's shape must be round like a ball. Eclipse after eclipse, they saw that the Earth cast a round shadow, and deduced that we lived on a ball-shaped planet (long before we had pictures of it from space).

Note the round shadow. Photo: Brian Day NASA, shows a 100% eclipse; August's will be 93%.

6. The Eclipse from the Moon

An eclipse of the Moon from Earth can be seen as an eclipse of the Sun (by the Earth) from the Moon. See the diagram on page 1 and imagine you are on the side of the Moon facing Earth, perhaps sitting on the wall of a crater. You would look up, and see the Earth slowly moving in front of the Sun, creating a solar eclipse. It's too bad that there will no one on the Moon to see this eclipse. (The Artemis II mission got back from the Moon safely, leaving no observers behind.)

Andrew Fraknoi is a retired astronomer, textbook author, and college professor. He is the lead author of a free, on-line astronomy textbook at: http://bit.ly/astronomytextbook (now the most frequently-used introductory astronomy textbook in the U.S.) and writes science fiction stories on astronomical themes (13 published so far). He is co-author (with Dennis Schatz) of a children's book about eclipses: *When the Sun Goes Dark* and appears regularly on regional and national radio programs explaining astronomy. You can read his fiction, and see more about his educational work and writings, at https://fraknoi.com The International Astronomical Union has named Asteroid 4859 Asteroid Fraknoi in recognition of his work advancing the public understanding of science.
